

Part 3 · Hands-On Case Study: Life Is Beautiful Monthly Sales Tool

AI Fluency Workshop · IIM Nagpur · Neelukumari Jain, CA · Samyag Synergy

The situation

Life Is Beautiful is a fictional chain of 6 stores across Nagpur, Amravati, Wardha and Chandrapur. Every month each store exports its sales to a CSV file and head office combines them. The September 2026 file has just arrived, and it is messy. The regional manager needs a one-page sales summary tomorrow morning. Doing it by hand takes about three hours.

Your job: use an AI assistant to build a small tool that does it in about a minute, and that someone could trust.

Your 30 minutes

Time	What you do
5 min	Read this brief and write your CO-STAR prompt
15 min	Build the tool with your AI assistant, using only the sample data provided
7 min	Test it, run the safety check below, and write your 3-line note
3 min	Save your file, then scan the QR code for Quiz 4

What your tool must do

1. **Load** the provided file: Life Is Beautiful__sept2026_sales.csv
2. **Clean** it. The file has several kinds of data problems, and finding them is part of the task.
3. **Check** it. Flag any row that looks wrong instead of silently changing it.
4. **Summarise** it: total net sales, sales by store, sales by category, top 3 products, and the split by payment mode.
5. **Say one useful thing**: one plain-English insight a regional manager could act on.
6. **Protect privacy**: the Customer_Mobile column must not appear in your output (hide it, or show only the last 4 digits).

Stretch goals (only if you finish early): a chart, a 'download cleaned file' button, an issues log showing what was changed and why.

Rules

- Use only the sample data provided. It is fictional. Never use real data from your workplace.
- Use any AI assistant you like.

- Build it as one HTML file (recommended), or as an Excel or Google Sheet with formulas or a script.
- Keep a copy of the prompts you use.
- Do not trust the AI blindly. Check at least two numbers by hand before you submit.

Starter prompt (CO-STAR): copy, edit, paste

- **Context:** I am a business analyst at Life Is Beautiful , a 6-store chain. I have a monthly sales CSV (columns: Txn_ID, Date, Store, City, Category, Product, Qty, Unit_Price, Discount_Pct, Amount, Payment_Mode, Customer_Mobile). The file has data quality problems.
- **Objective:** Build a tool that loads the CSV, profiles the problems first, cleans them with clear rules, flags suspicious rows, and summarises sales.
- **Style:** Simple, readable code with comments. Show an issues log of every change made.
- **Tone:** Plain and practical.
- **Audience:** A regional manager who is not technical.
- **Response:** One self-contained HTML file with a file-upload button, summary tables, and one insight sentence. Hide the Customer_Mobile column. Never invent numbers.

Tip: ask the AI to list the data problems it finds before it writes any cleaning code.

Safety check before you submit

- Does the tool still work if someone uploads a slightly different file?
- Did you check two totals by hand?
- Is Customer_Mobile hidden or masked?
- Does your note say which parts the AI wrote and what you verified?

What to submit (after the session)

The facilitator will share the submission form link on screen and in the WhatsApp group, along with the deadline. The form asks for:

1. Your name and number
2. A link to your working tool (Google Drive link set to 'Anyone with the link can view'), or paste the HTML if you have no link
3. Your CO-STAR prompt(s)
4. A 3-line note: what the tool does, how you checked the output, and one risk you handled
5. A tick to confirm you used only the sample data and marked the AI-assisted parts

How you will be scored (100 points)

Criterion	Points
Works from start to finish on the sample file	25
Accuracy of cleaning and totals	25
Useful insight and clear summary	15

Criterion	Points
Prompt and process quality (CO-STAR, checks)	15
Responsible use (privacy, human checks, honesty about AI use)	20

AI-assisted work is expected. You are scored on judgement and verification, not on typing the code yourself.
